                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cterminal regions. The invention relates to a monoclonal antibody, or fragments thereof, which is specifically reactive with the truncated human VEGF-D, and methods of preparing the antibody. The antibody of the invention interferes with the binding of VEGF-D to the VEGF receptors VEGFR-2 and VEGFR-3, but does not interfere with the binding of VEGF to these receptors and additionally is not reactive with VEGF-C. The antibody may be used to treat disorders associated with vascular permeability, endothelial cell proliferation, anglogenesis, lymphangiogenesis, neovascularisation and endothelial cell ground arthropathies. The antibody may also be used to treat fluid accumulation in the heart and/or lung via modulation of vascular permeability. It may additionally be used to detect VEGF-D and may be used to image lymphatic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      collateral circulation in tissue infarction or arterial stenosis.

C such as coronary artery disease, and inhibition of angiogenesis in the treatment of cancer or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and O2 gas gas remeability in cases of cardiac insufficiency, to improve blood forward gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract.

Quantitation of VEGF.D in cancer biopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                    DAX AX I
                                                                                                                                                                                                                                                                                                                                                                                                                                            detecting mutations or the presence or amount of anglogenic protein CC expression. Particularly they are used to stimulate wound healing, CC especially peripheral arterial disease, critical limb ischaemia or cc coronary disease. Antagonists of the sequences are used to inhibit CC angiogenesis in tumours and to treat inflammation (where associated with CC arthritis or psoriasis. Agonists are also useful for stimulating CC (lymph)angiogenesis. The proteins are also useful for stimulating CC (lymph)angiogenesis. The proteins are also useful to raise antibodies. CC purification and targeting of proteins for in vivo or in vitro diagnosis (including imaging) or for therapputic (antiagonists; for detection, CC purification and targeting of proteins for in vivo or in vitro diagnosis CC (including imaging) or for therappy (including when linked to e.g. a label CC or cytotoxin); and for immunotyping of cells. e.g. for detection minimal CC residual disease or haematopoietic progenitor/stem cells. It is also CC contemplated that the sequences might be useful for treating a very wide crange of other disorders, e.g. autoimmune diseases; allergy; cancer; infectious diseases (viral, bacterial, fungal or parasitic); neurodegeneration of the nervous system etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    X D D X X

                                                                                                                                                                    by the zvegf2 cDNA which was isolated from a human heart cDNA library. zvegf2 protein in a dimeric form acts as a mitogen for fibroblasts or smooth muscle cells. zvegf2 is claimed to be useful for stimulating the revascularisation of tissue or the re-endothelialisation of vascular tissue. zvefg2 is particularly claimed to be useful for the treatment of full-thickness skin wounds, including venous stasis ulcers and diabetic ulcers. The zvegf2 protein is also claimed to be useful as an additive in tissue adhesives for promoting revascularisation of the healing tissue. Antagonists against zvegf2 can be used to block its mitogenic, chemotactic and angiogenic effects. The antagonists may therefore be useful for reducing growth of solid tumours by inhibiting neovascularisation of the developing tumour or by directly blocking tumour cell growth, in the treatment of diabetic retinopathy, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated vascular endothelial growth factor - used to develop products for treating e.g. wounds, burns, myocardial infarction, tumours, psoriasis, arthritis, restenosis or organ transplants
                                                                                                             Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ω
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        뫄
in the lung and/or gaseous exchange between the lungs and the blood stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract. Quantitation of VEGF-D in cancer blopsy specimens may be useful as an indicator of future metastatic risk. Antagonists can be used for treating e.g. conditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-NOV-1996;

                                                                                                                                       The sequence is that of human lung vascular endothelial growth factor D (VEGF-D). VEGF-D can be used for e.g. acceleration of angiogenesis in wound healing, tissue or organ transplantation, or to establish collateral circulation in tissue infarction or arterial stemosis, such as coronary artery disease, and inhibition of angiogenesis in the treatment of cancer or of diabetic retinopathy. It can also be used in the treatment of lung disorders to improve blood circulation

                                                                                                                                                                                                                                                                                                                                                                                              regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote the prospective of the product of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, and the promote the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the product of the produc
                                                                                                                                                                                                                                                                                             skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity vascularization. This sequence represents the human VEGD protein used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antitheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostatic; antitheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore; venous sore; diabetic ulcer; burns; skin graft growth; VEGD.

                                                                                                                                                                   дb
                                                                                                                                                                                                                The present sequence is the protein sequence of the human vascular endothelial growth factor D (VEGF-D). It was used to demonstrate the methods of the invention, which involve the screening of individuals to determine which vascular endothelial growth factor receptor 3 (VEGFR-3, also known as Flt4 or fms-like tyrosine kinase 4) alleles they possess and thus their likelihood of developing hereditary lymphoedema. Conditions associated with lymphoedema include Milroy-Nonne syndrome,
                                                                                                                                                                                                                                                                                                                                              Screening a human subject for increased risk of developing disorder, comprises assaying a nucleic acid to determine a altering the sequence of a vascular endothelial growth fact receptor-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   vascular endothelial growth factor receptor 3; VEGF-D; Milroy-Nonne syndrome; lymphoedema praecox; VEGF-D; vascular endothelial growth factor D.

CC ligand to Fit4 thereby inhibiting Fit4 mediated proliferation of vascular cells cells. The compound is useful for treating neoplastic disease cuch as breast carcinomas, squamous cell carcinomas, lymphomas, melanomas can disease cuch as compounds carcinomas, squamous cell carcinomas, lymphomas, melanomas cuch as arcomas. Fit4 receptor tyrosine kinase binding compounds can be used for manufacturing medicament useful for diagnostic screening, imaging and cuch reatment of malignancies characterised by Fit4 expressing blood cells. The Fit4 gene maps to chromosomal region 5q35 and is expressed as 5.8 kb and 4.5 kb mRNAs which differ in their 3' sequences and are cuch fiferentially expressed in HEL and DAMI cell lines. Fit4 cuch substantly of class III receptor tyrosine kinases (RTKS). It is used as a target for tumour imaging and anti-tumour therapy. CC The present sequence is a human prepro-vascular endothelial growth factor D (VEGF-D), a specific example of Fit4 binding compound. A cc recombinantly matured VEGF-D lacking residues 1-92 and 202-354 cc retains the ability to activate VEGFR-2 and VEGFR-3 receptors and

                                                                                                                                                              The present amino acid sequence is the complete human prepro-vascular endothelial growth factor (VEGF)-D. VEGF-D has the ability to stimulate re-endothelialisation of an injured blood vessel, without significant stimulation of smooth muscle cell proliferation. It can bind to and stimulate VEGFR-2 (vascular endothelial growth factor receptor) and/or VEGFR-3 phosphorylation in cells that express such receptors. An
                                                                                                                                                                                                                                                                                                                                                                                                                              Preventing stenosis and restenosis endothelial growth factor proteins
                                               anti-restenosis agent comprising either a VEGF-D gene or protein is used in a method to reduce or prevent restenosis and stenosis of a blood vessel following vascular trauma e.g., cardiovascular surgery and percutaneous transluminal coronary angioplasty.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vascular endothelial growth factor-D; VEGF; human; re-endothelialisation; vascular endothelial growth factor receptor; VEGFR; vascular trauma; blood vessel; cardiovascular surgery; anti-restenosis agent; prevention; restenosis; stenosis; percutaneous transluminal coronary angioplasty.

(lymph)angiogenesis. The proteins are also used to identify specific binding agents (potential therapeutic agents) and to raise antibodies. The antibodies are useful as therapeutic (ant)agonists; for detection, purification and targeting of proteins for in vivo or in vitro diagnosis (including imaging) or for therapy (including when linked to e.g. a label or cytotoxin); and for immunotyping of cells, e.g. for detecting minimal residual disease or haematopoietic progenitor/stem cells. It is also
                                                                                                                            increased vascular permeability), diabetic retinopathy, rheumatoid arthritis or psoriasis. Agonists are also useful for stimulating
                                                                                                                                                              coronary disease. Antagonists of the sequences are used to inhibit angiogenesis in tumours and to treat inflammation (where associated with

                       The present invention relates to a method for screening a human subject for an increased risk of developing a lymphatic disorder e.g. hereditary lymphedoema. The method comprises assaying nucleic acid of a human subject to determine a presence or an absence of a mutation altering the sequence or expression of vascular endothelial growth factor receptor-3 (YEGFR-3)/fms-like tyrosine kinase 4 (Flt4) allele (see AAC68952 and AAB37604) and determining an increased risk of developing lymphatic disorder from presence or absence of the mutation. The presence of a mutation altering the encoded amino acid sequence or expression of at least 1 VEGFR-3 allele in the nucleic acid correlates with an increased risk of developing a lymphatic disorder from the nucleic acid correlates with an increased risk of developing lymphatic disorder from presence or absence of the mutation. The presence of a mutation altering the encoded amino acid sequence or expression of at least 1 VEGFR-3 allele in the nucleic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with an increased risk of developing lymphatic acid correlates with a lymphatic acid correlates with a lymphatic acid correlates with a lymphatic acid correlates with a lymphatic acid correlates with a lymphatic acid correlates with a lymphatic acid correlates with a lymp

                                   The present invention describes a method for inducing angiogenesis in a tissue, or area, in need of angiogenesis, in a mammal. The method comprises administering recombinant vascular endothelial growth factor D (VEGF-D) or its angiogenically active fragment or mutant (I). The present sequence represents the human VEGF-D protein, which can be used in the method of the invention. (I) has cardiant and vasotropic activities, and is an angiogenesis inducer. The method can be used for inducing angiogenesis in a tissue in need of angiogenesis, or in an area in need of angiogenesis in a mammal. (I) is useful for treating various ischaemic conditions manifested by vascular insufficiency such as
                                                                                                                                                                                                                                         Use of recombinant vascular endothelial growth factor or its angiogenically active fragment or mutant, for inducing angiogenesis vivo or in vitro and for treating myocardial infarction, coronary

sequences of reading frames 1, 2 and 3 of clone HF175 (AAT62961), human homologue of murine clone F0401 (AAT62960), which codes for novel c-Fos induced growth factor (F1GF) (see also AAM14922). Examination of the 3 polypeptides indicates that reading frame 2 has the longest region free of nonsense codons. FIGF is a c-fos-dependent autocrine growth factor able to induce cell division entry and, when over-expressed, a transformed phenotype in fibroblasts. It could be implicated in tumours and development. Recombinant FIGF can be produced in transformed host (e.g. CHO) cells. It can be used to identify its receptors and in an assay for the identification of agonists and antagonists. Antibodies
                                                                                                                                                                                    Nucleotide molecule encoding c-Fos induced growth factor protein useful in therapy, in manufacture of compositions for treatment developmental disorders and in generation of transgenic animal
